

*eciCMYK v2 (FOGRA59) is the successor of the previous version »eciCMYK«. The new profile is based on the enhanced color characterisation data set »FOGRA59«. While the color gamut remains unchanged, the major benefit is an enhanced grey balance, which delivers cyan, magenta and yellow tone values similar to familiar tone values. For that reason, »eciCMYK v2« not only provides the advantages of a large color gamut and proofability. In addition to that, tests with day to day production jobs showed better output on printing systems with larger color gamuts: Simply assigning »eciCMYK v2« to print files prepared for offset on premium coated stock (unchanged tone values) shows higher contrast and more vivid colors in the printed output.*
